DOCUMENT-IDENTIFIER: US 5657141 A TITLE: Liquid crystal device

BSPR:

This invention relates to a liquid crystal device to be used in a <u>liquid</u> <u>crystal display</u> device or a liquid crystal-optical shutter, etc., particularly a liquid crystal device using of a ferroelectric liquid crystal, and a <u>liquid</u> <u>crystal display</u> apparatus using the liquid crystal device.

BSPR:

More specifically, there has been disclosed a <u>display</u> apparatus including a <u>display</u> panel comprising <u>scanning electrodes</u> and data <u>electrodes</u> arranged in a matrix, whole-area writing means for <u>selecting</u> all or a prescribed <u>part of the scanning electrodes</u> for writing and partial writing means for <u>selecting a part</u> of the above-mentioned all or a prescribed <u>part of the scanning electrodes</u>. As a result, a partial motion picture display can be performed at a high speed by the partial writing mode, and the partial writing and the whole-area writing can be performed compatibly.

BSPR:

An object of the present invention is to provide a liquid crystal device having a good shock resistance particularly at low temperature and a <u>liquid crystal</u> <u>display</u> apparatus using the liquid crystal device.

BSPR:

Another object of the present invention is to provide a liquid crystal device having an excellent low temperature storage properties and a <u>liquid crystal</u> <u>display</u> apparatus using the liquid crystal device.

BSPR:

According to the present invention, there is further provided a <u>liquid crystal</u> <u>display</u> apparatus comprising the above liquid crystal device, a drive circuit for driving the liquid crystal device and a light source.

DRPR:

FIG. 6 is a block diagram of a <u>liquid crystal display</u> apparatus and a graphic controller.

02/15/2002, EAST Version: 1.03.0002

DRPR:

FIG. 7 is a time chart showing time correlation for image data communication between the <u>liquid crystal display</u> apparatus and the graphic controller.

DEPR:

A <u>liquid crystal display</u> apparatus may be constituted by using the liquid crystal device for a display panel and by adopting an arrangement and data format comprising image data accompanied with scanning line address data and also a communication synchronization scheme using a SYNC signal as shown in FIGS. 6 and 7.

DEPR:

Referring to FIG. 6, the <u>liquid crystal display</u> apparatus 101 includes a graphic controller 102, a display panel 103, a scanning line drive circuit 104, a data line drive circuit 105, a decoder 106, a scanning signal generator 107, a shift resistor 108, a line memory 109, a data signal generator 110, a drive control circuit 111, a graphic central processing unit (GCPU) 112, a host central processing unit (host CPU) 113, and an image data storage memory (VRAM) 114.

DEPR:

Image data are generated in the graphic controller 102 in an apparatus body and transferred to the display panel 103 (illuminated with a backlight (not shown)) by signal transfer means shown in FIGS. 6 and 7. The graphic controller 102 principally comprises a CPU (or GCPU, central processing unit) 112 and a VRAM (video-RAM, image data storage memory) 114 and is in charge of management and communication of image data between a host CPU 113 and the <u>liquid crystal</u> <u>display</u> apparatus (FLCD) 101. The control of image display according to the present invention is principally accomplished by the graphic controller 102. Incidentally, a light source is disposed at the back of the display panel 103.

DEPR:

Each of the liquid crystal compositions A-H and the ferroelectric liquid crystals (ZLI-3233 and CS-1014) was cooled to 30.degree. C. providing chiral smectic C phase through phases including **cholesteric** phase and smectic A phase or smectic A phase.
